SUMMARY

Final-year Computer Engineering student who builds full-stack, AI-integrated web applications — from backend architecture and databases to CI/CD and cloud deployment. Practices algorithmic problem-solving (DSA) regularly and applies it directly in two working projects covering AI integration, security engineering, and automated testing.

KEY SKILLS

Frontend: React.js, Next.js, Redux/Context API, Tailwind CSS, HTML5, CSS3.
Backend: Node.js, Express.js, RESTful API design, JWT auth, rate limiting, input validation.
DevOps & Cloud: Docker, GitHub Actions (CI/CD), AWS (EC2, ECR, ECS, RDS), Terraform (IaC), Git/GitHub.
Databases: MongoDB, PostgreSQL, Redis.
Languages: JavaScript, TypeScript, Java, C, Python.
Testing: Vitest, Jest, unit & integration testing.
Security: AES-256-GCM encryption, Argon2id, bcrypt, OAuth/JWT flows.

PROJECTS

Researcher Campus — AI-Powered Academic Research Pipeline

July 2026 – Aug 2026

Full-stack Web App | researcher-campus.vercel.app | github.com/jayesh-thar/Researcher-Campus

- Built a 7-stage AI research pipeline — novelty check, gap analysis, manuscript drafting, compliance audit — replacing 5+ manual research tools with one workflow.
- Built a real-time novelty-detection engine across 5 academic APIs (Crossref, arXiv, OpenAlex, Semantic Scholar, Europe PMC) using 768-dim vector embeddings with a TF-IDF offline fallback.
- Designed a 5-tier Gemini fallback chain with auto-failover for proposal generation and a 4-guard compliance auditor (citations, anonymity, formatting, tone).
- Secured 31 REST endpoints with JWT auth and AES-256-GCM encryption; sustained ~7,000 req/sec at 0 errors under load testing, backed by 21 automated tests and 0 TypeScript errors.
- Deployed backend via Docker on AWS ECS Fargate, provisioned with Terraform; added GitHub Actions CI/CD and an RDS-based audit-logging layer alongside MongoDB.

VaultX — Zero-Knowledge Encrypted Credential Vault

Jan 2026 – Mar 2026

Web app + Chrome MV3 extension | vault-x.xyz | github.com/jayesh-thar/vault-x

- Built a zero-knowledge password vault (web + Chrome extension) with client-side AES-256-GCM/PBKDF2-SHA256 (600K iterations) encryption — server never sees plaintext; ~7,000 ops/sec.
- Designed a recovery-key system for vault-preserving password resets, avoiding the full data loss typical zero-knowledge vaults require on reset.
- Built a 33-endpoint REST API with JWT refresh-token rotation and reuse detection that auto-invalidates sessions on theft.
- Added TOTP 2FA, HIBP breach checks (k-anonymity), one-time share links, and password-health scoring.
- Built the React/Vite/Tailwind frontend with autofill, 5-format CSV import, and a Chrome MV3 extension for auto-capture and PIN-protected cards; 37 unit tests, 100% core coverage.

ACHIEVEMENTS & EXTRACURRICULAR

[Hack the Mountain](#) — Participated in a competitive hackathon; designed and built a working prototype under strict time constraints.

[Eliet Coder](#) — Open Source Event — Participated in an open-source contribution event, collaborating on live codebases.

EDUCATION

Bachelor of Technology in Computer Engineering

2023 – 2027

Marwadi University | CGPA: 8.37 | No Backlog

CERTIFICATIONS

[AWS Academy Graduate — Cloud Foundations](#)

[DevOps Fundamentals — Infosys Springboard](#)

[Trailhead: Badge — Salesforce](#)
